An aerial photograph of a rural settlement, likely a homelands area, showing a cluster of tents and small buildings scattered across a wooded landscape. The trees are dense and green, and the ground is a mix of dirt and grass. The settlement appears to be in a valley or a clearing within the forest. The text is overlaid on the bottom right of the image.

**SAFE ACCESS TO WATER ON HOMELANDS:
A SOCIO-ECOLOGICAL FRAMEWORK**

A group of about seven people are gathered on a rocky riverbank. Some are sitting on the rocks, while one person is crouching by the water's edge, holding a long pole. In the foreground, a crocodile is swimming in the river. The background is filled with lush green trees and vegetation. The text "Water is the foundation of life" is overlaid in the center of the image.

Water is the foundation of life

Inequality of access

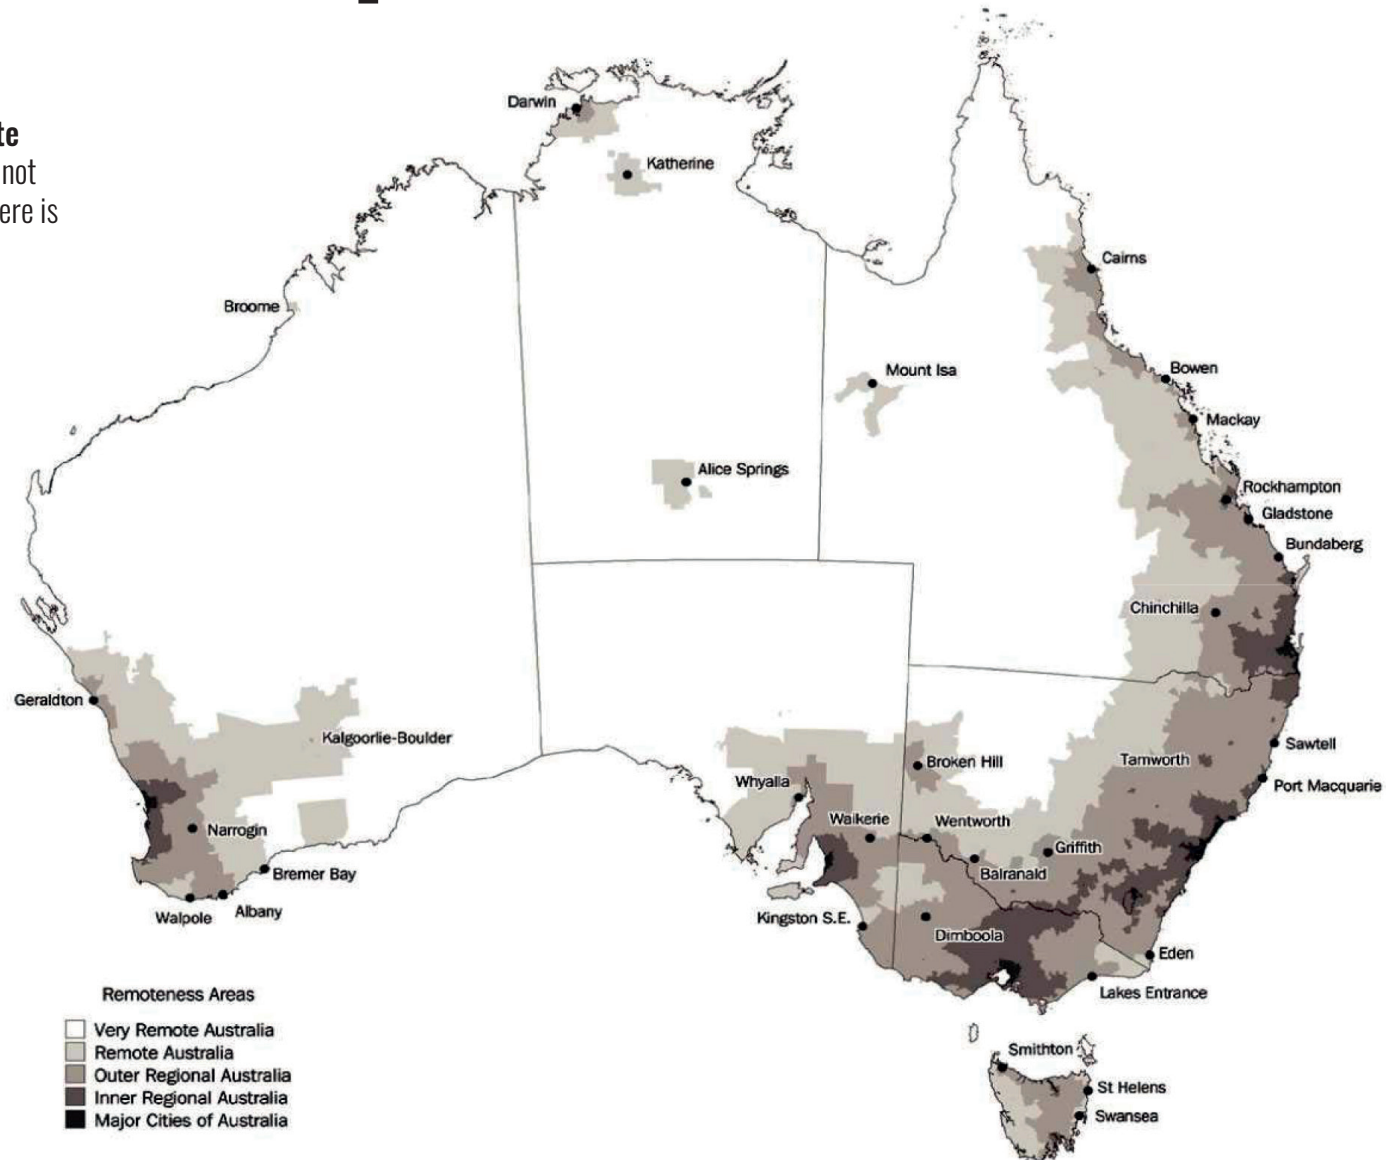

99.9% of Australia's urban population have access to safely managed drinking water.

This represents 96.5% of the total Australian population.

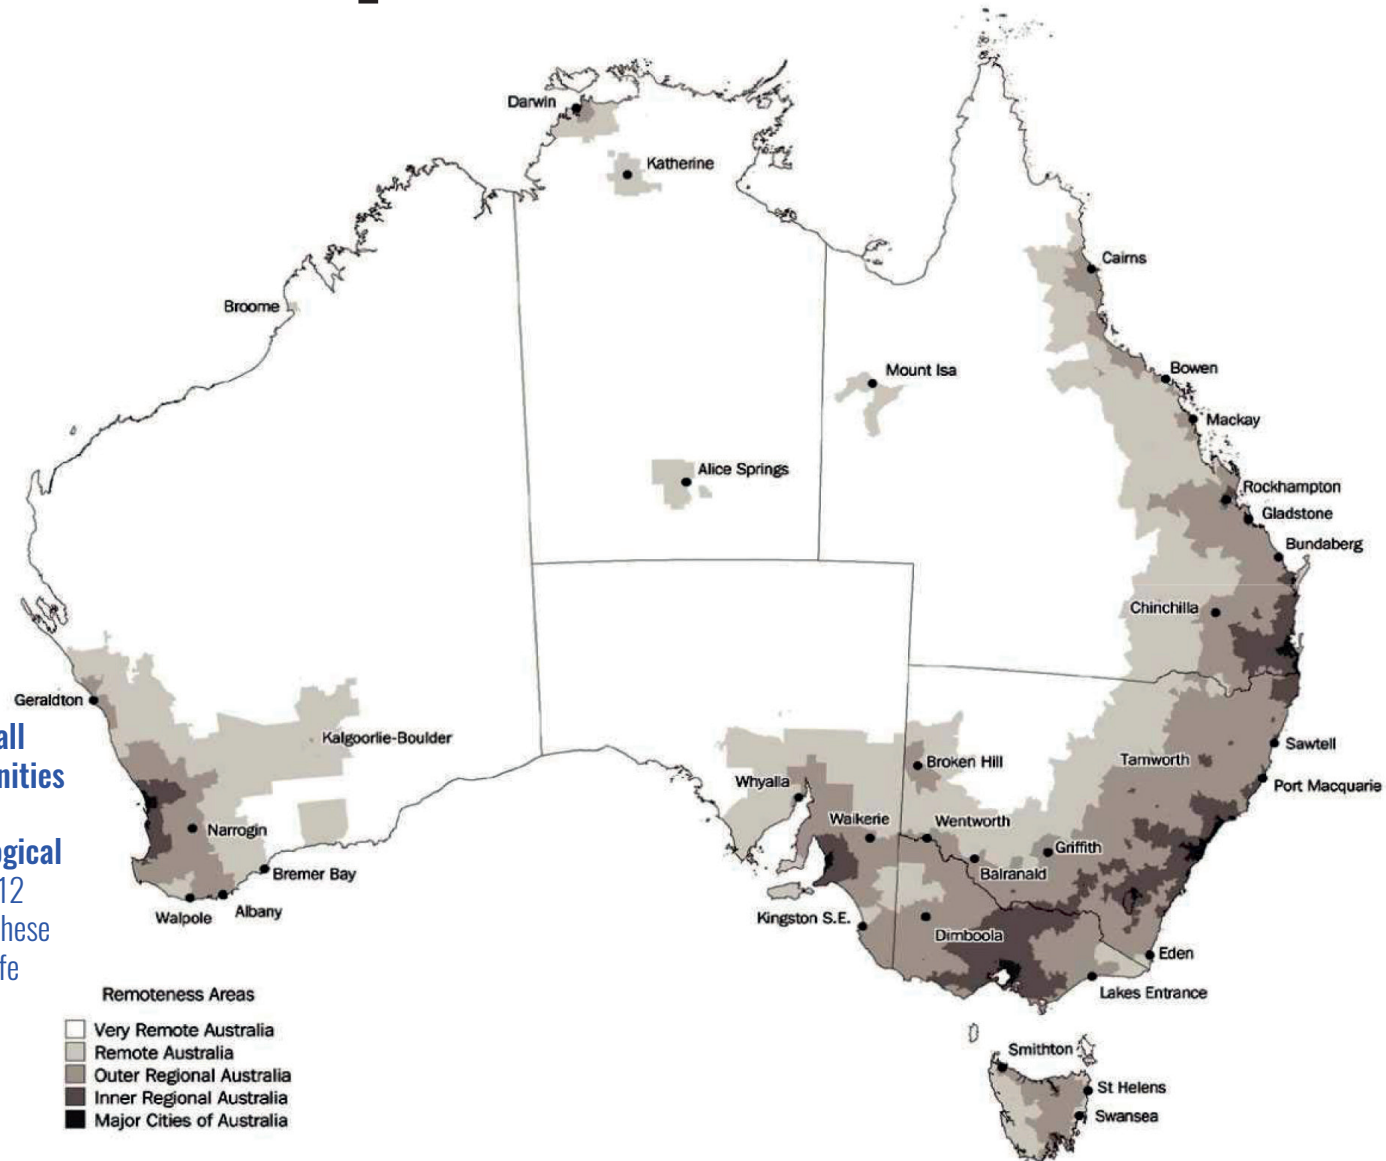

Inequality of access

In **3.5%** of Australians in **small towns, rural or remote communities** the water does not comply to safe standards or there is insufficient data.

Inequality of access

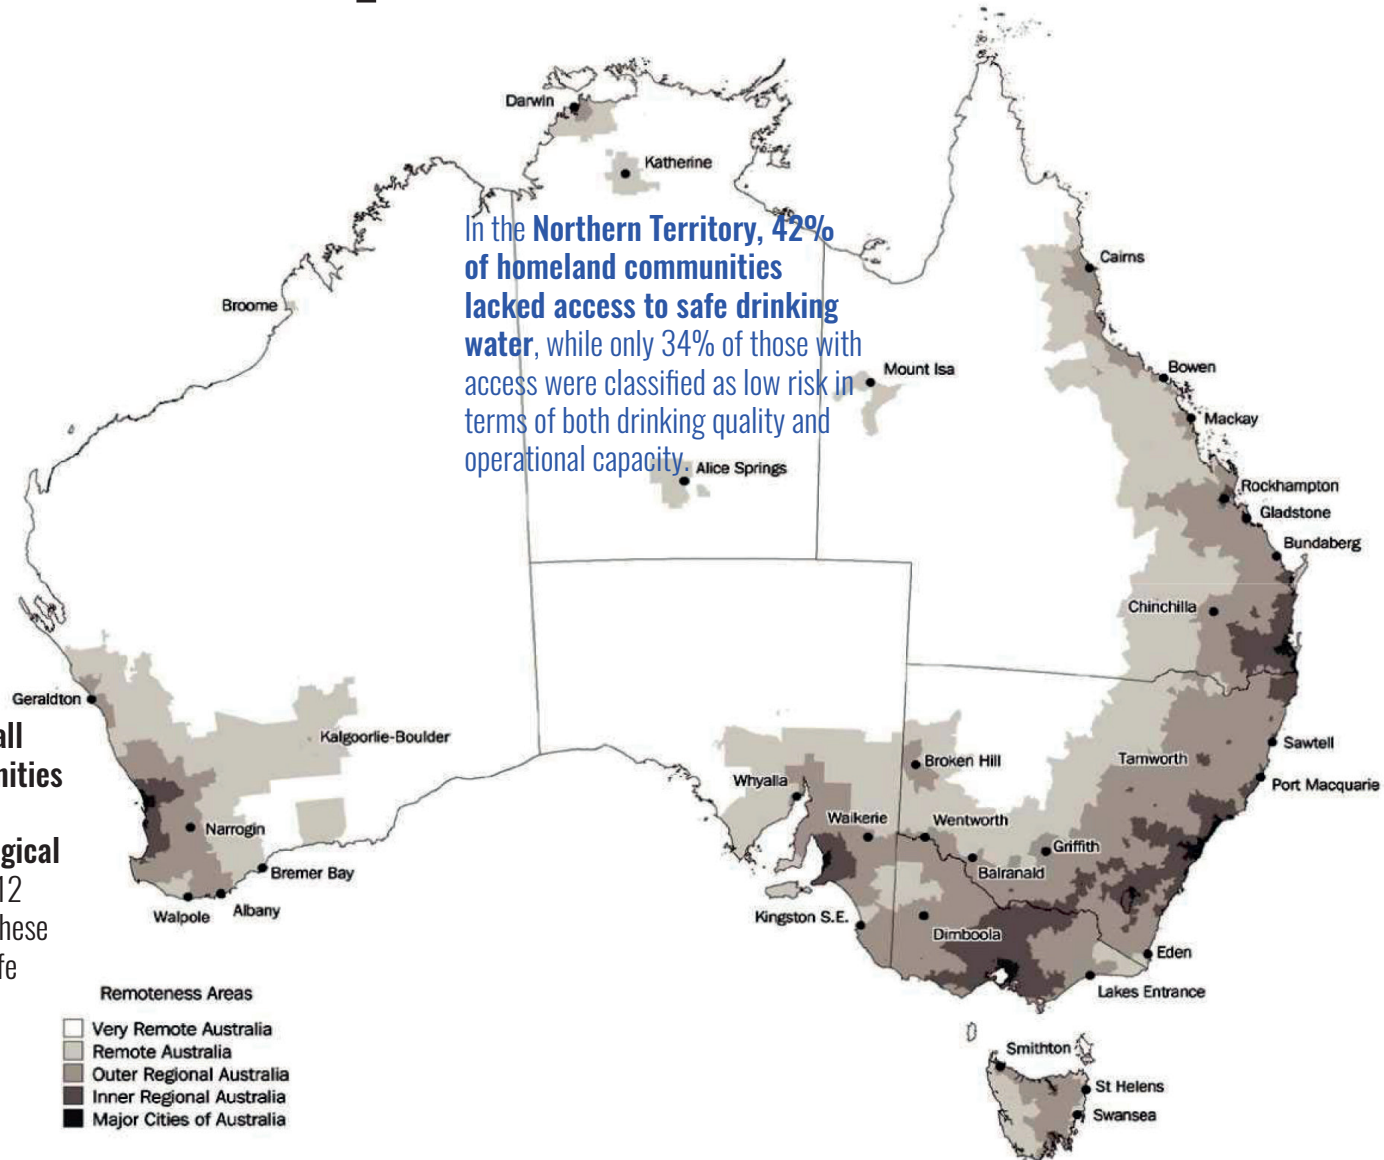

For Western Australia's small remote indigenous communities only 19% of communities reported 100% microbiological compliance between July 2012 and June 2014. One in five of these communities also exceeded safe levels for nitrates or uranium.

Inequality of access

In the Northern Territory, 42% of homeland communities lacked access to safe drinking water, while only 34% of those with access were classified as low risk in terms of both drinking quality and operational capacity.

For Western Australia's small remote indigenous communities only 19% of communities reported 100% microbiological compliance between July 2012 and June 2014. One in five of these communities also exceeded safe levels for nitrates or uranium.

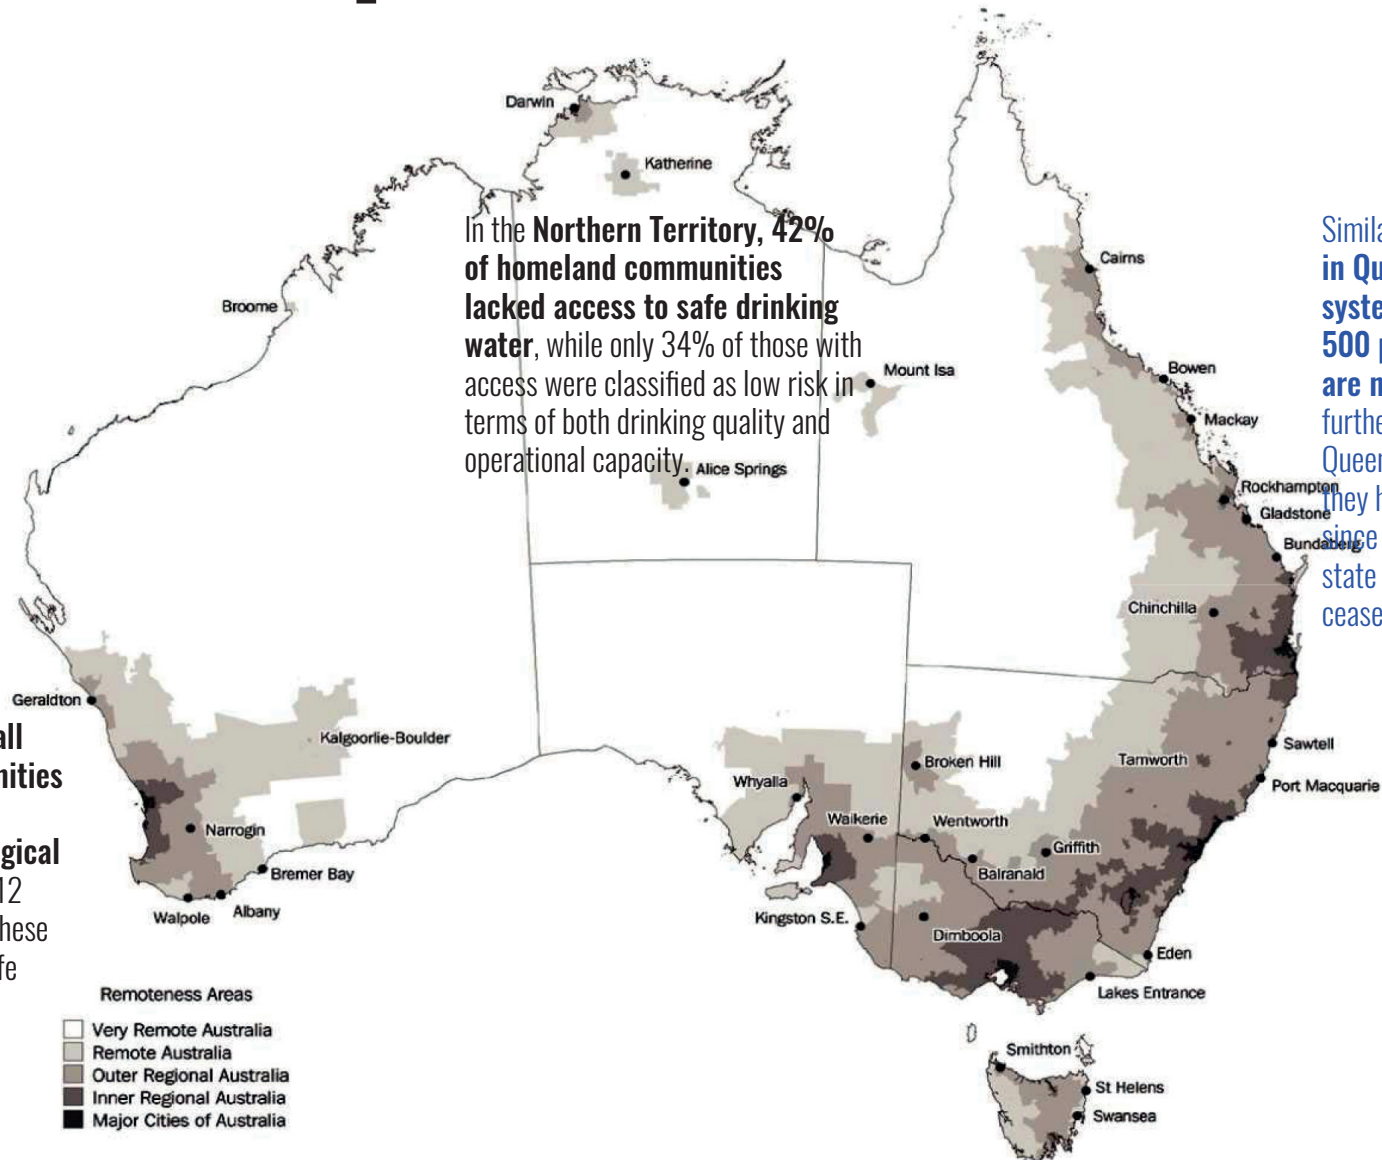

Inequality of access

In the Northern Territory, 42% of homeland communities lacked access to safe drinking water, while only 34% of those with access were classified as low risk in terms of both drinking quality and operational capacity.

Similarly for remote communities in Queensland, 44% of water systems service fewer than 500 people and 12% of these are not potable. There are further threats to the longevity of Queensland water supplies because they have been locally managed since 2009 when co-investment by state and local state government ceased.

For Western Australia's small remote indigenous communities only 19% of communities reported 100% microbiological compliance between July 2012 and June 2014. One in five of these communities also exceeded safe levels for nitrates or uranium.

Water Leadership for the Future

IWC - creating tomorrow's leaders in water management by changing the way people think about, act and solve complex water management challenges

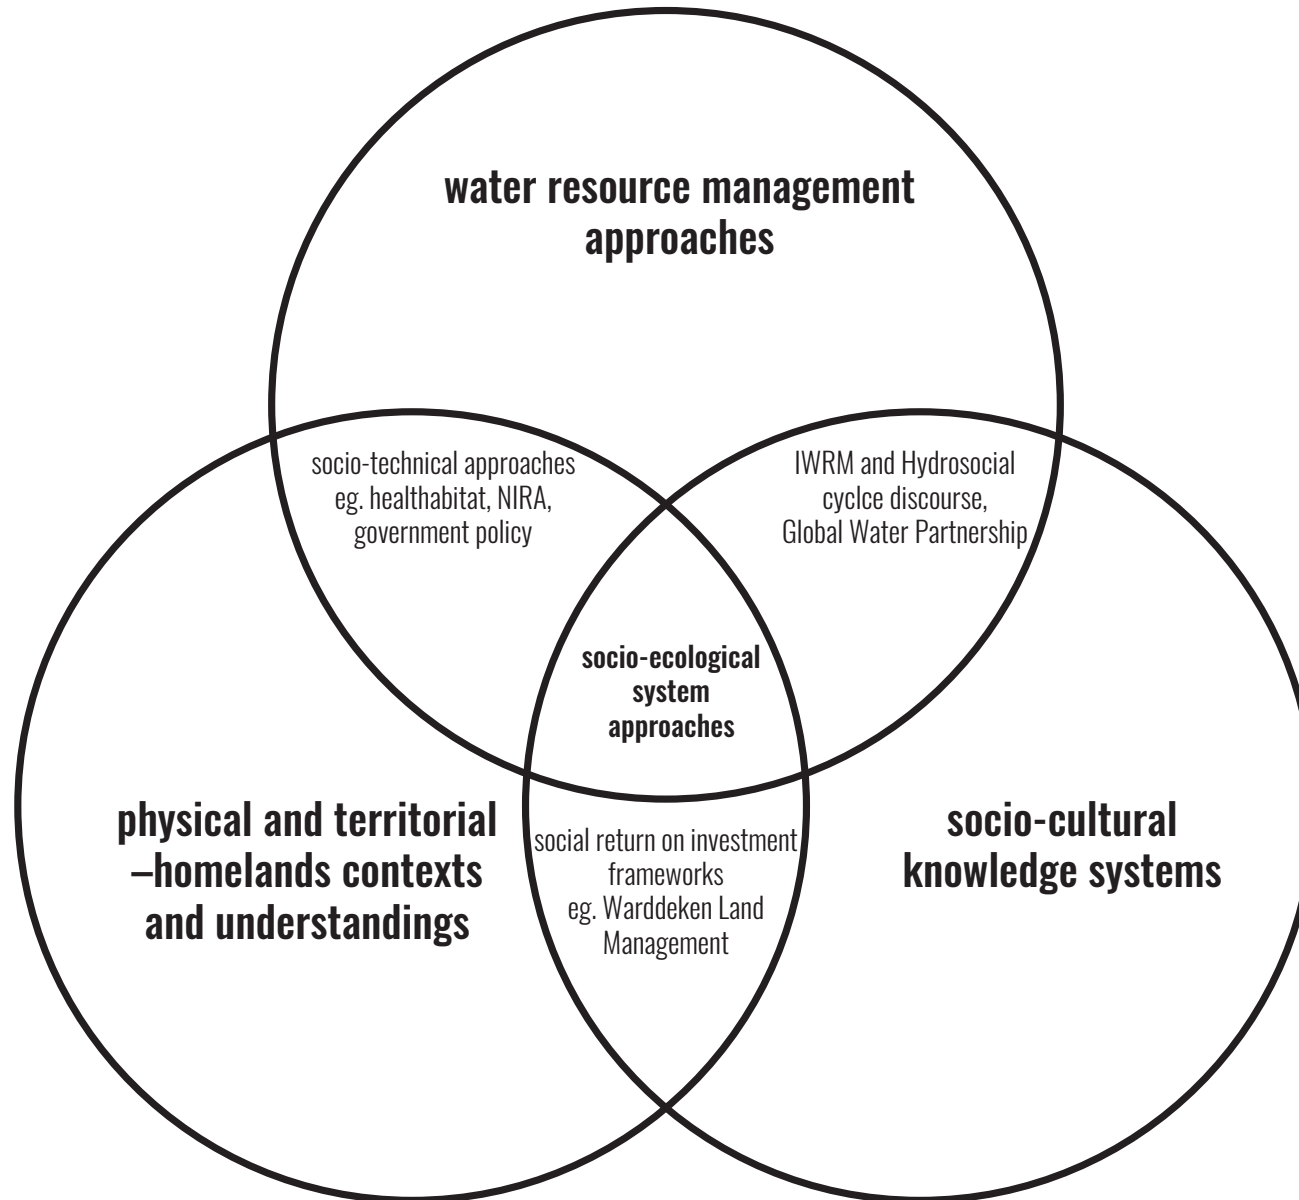

INTERNATIONAL WATERCENTRE

MEMBERS:

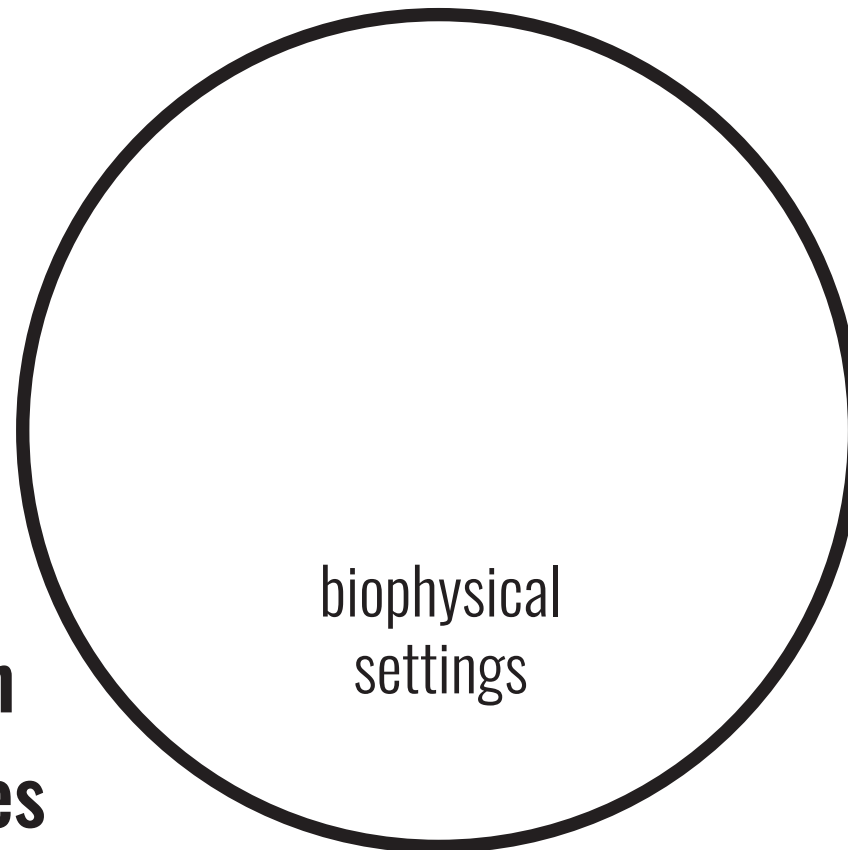

**What can we do to improve safe
access to water on homelands?**

Systematic rapid review

- territorial connections
- cultural connections
- climate (drought/flood)
- geology
- geography
- topography

**The co-influence between
water resourcing variables**

- ad hoc policy settings
- insufficient funding
- restrictive land tenure
- insufficient infrastructure
- insufficient water quality data

domestic contexts
and technologies

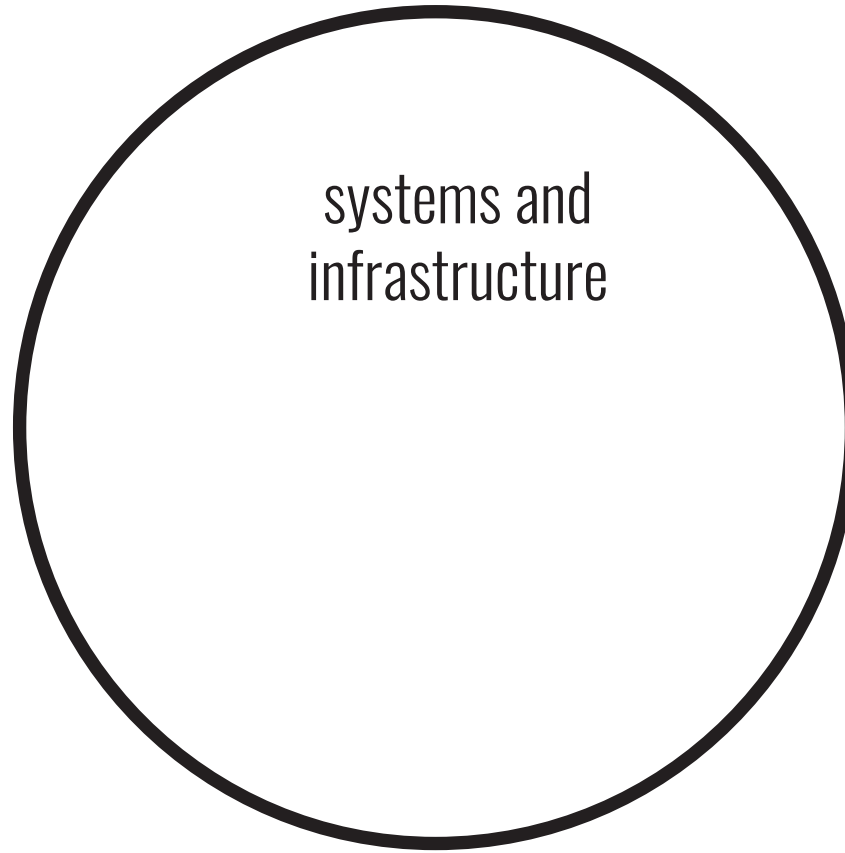

**The co-influence between
water resourcing variables**

The Northern Territory Homelands and Outstations Assets and Access Review

Final Report 2016

- remoteness
- lack of reticulated services
- urban centric systems
- poor levels of maintenance

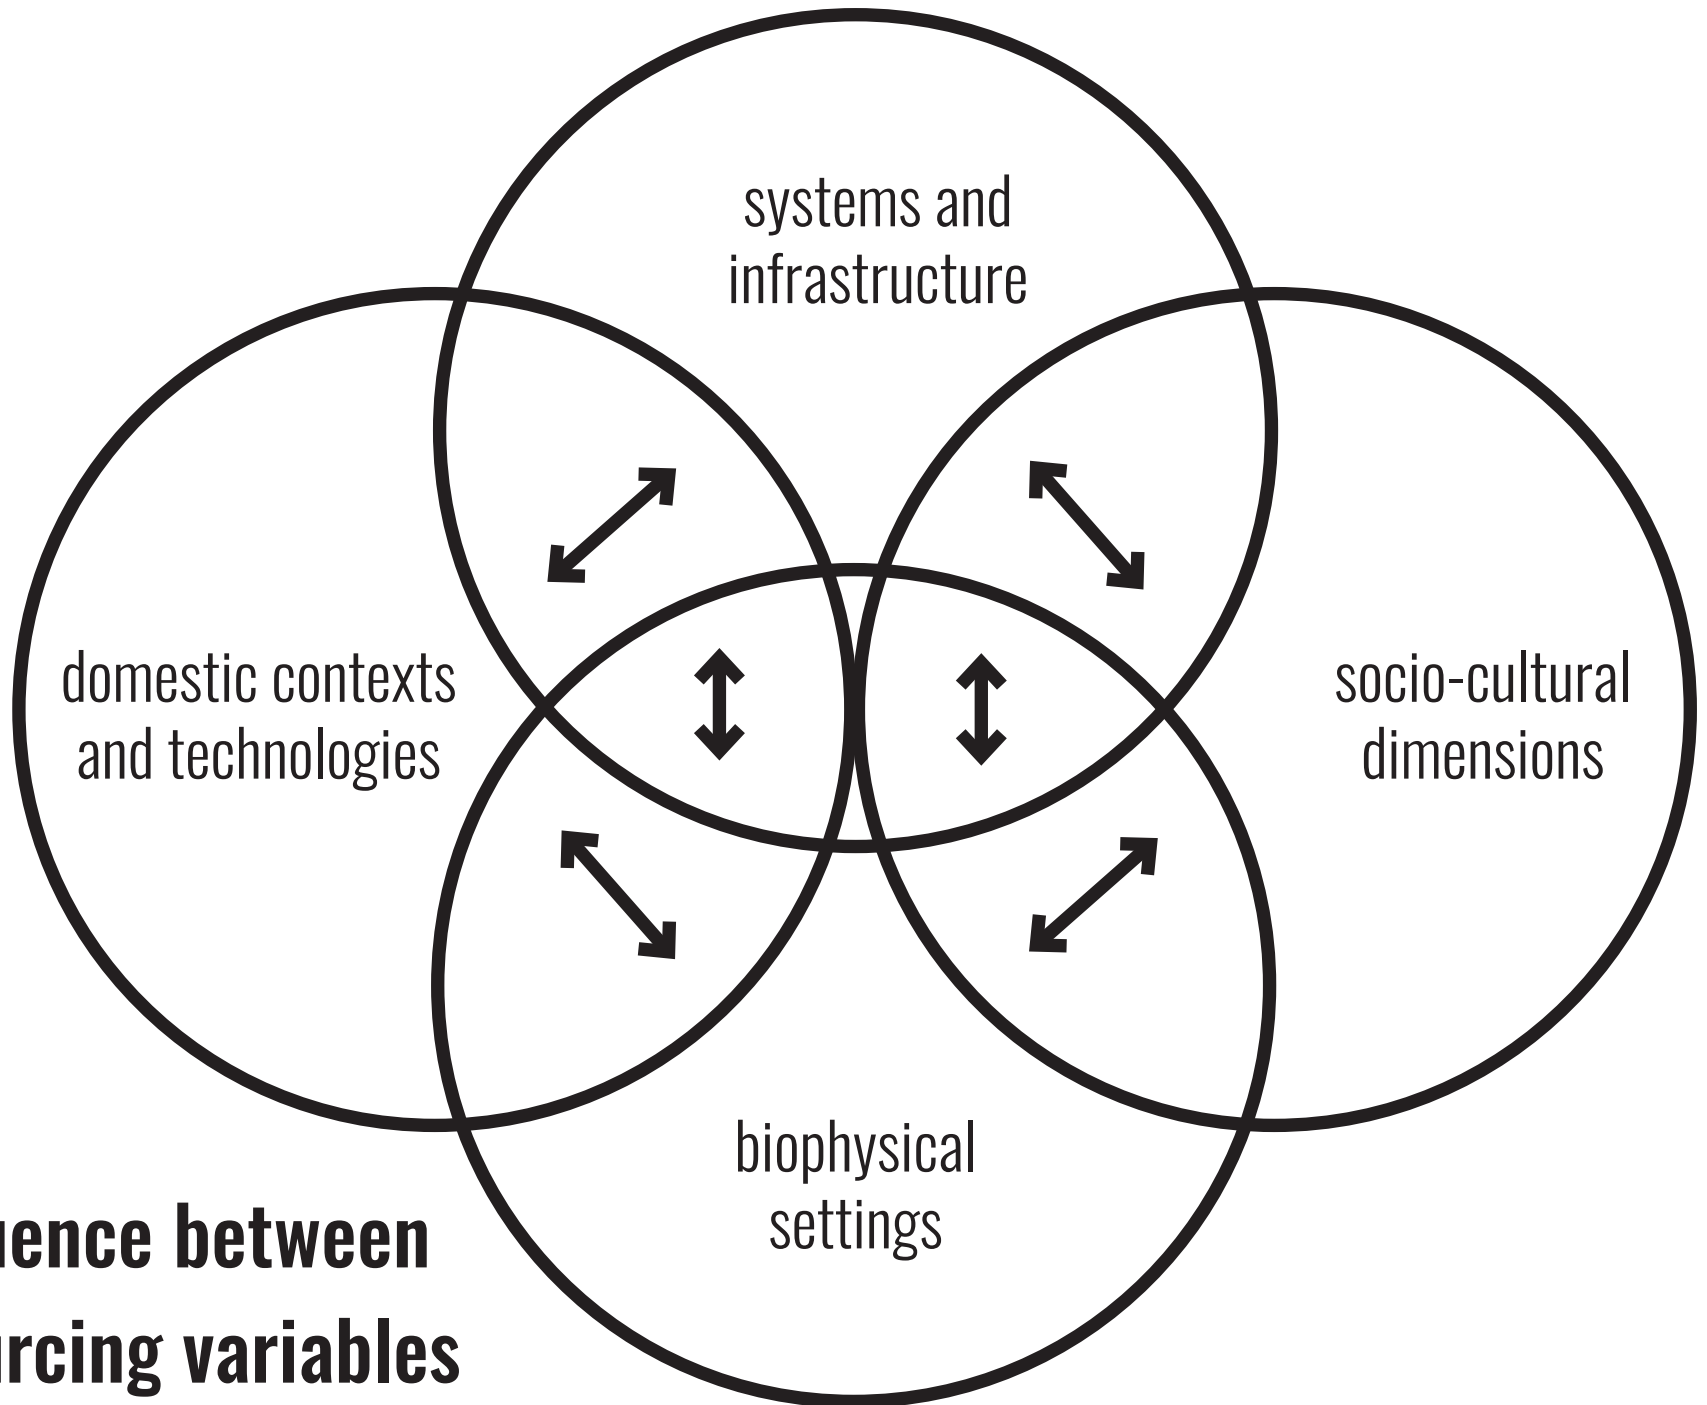

**The co-influence between
water resourcing variables**

- educational capacity
- meanings ascribed to water
- cultural knowledge

**The co-influence between
water resourcing variables**

**The co-influence between
water resourcing variables**

safe access to water

**Bio-physical conditions are complex.
Local skills and existing technologies.**

Social, cultural, economic and material settings determine experiences, needs and capacities.

community driven
bottom up

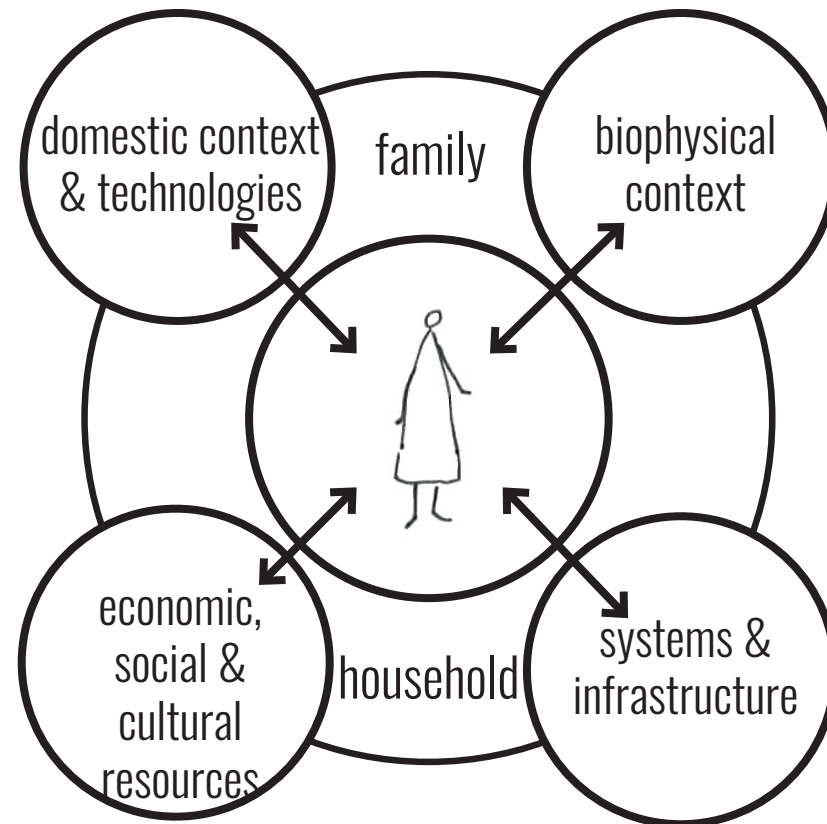

social drivers

micro

Micro

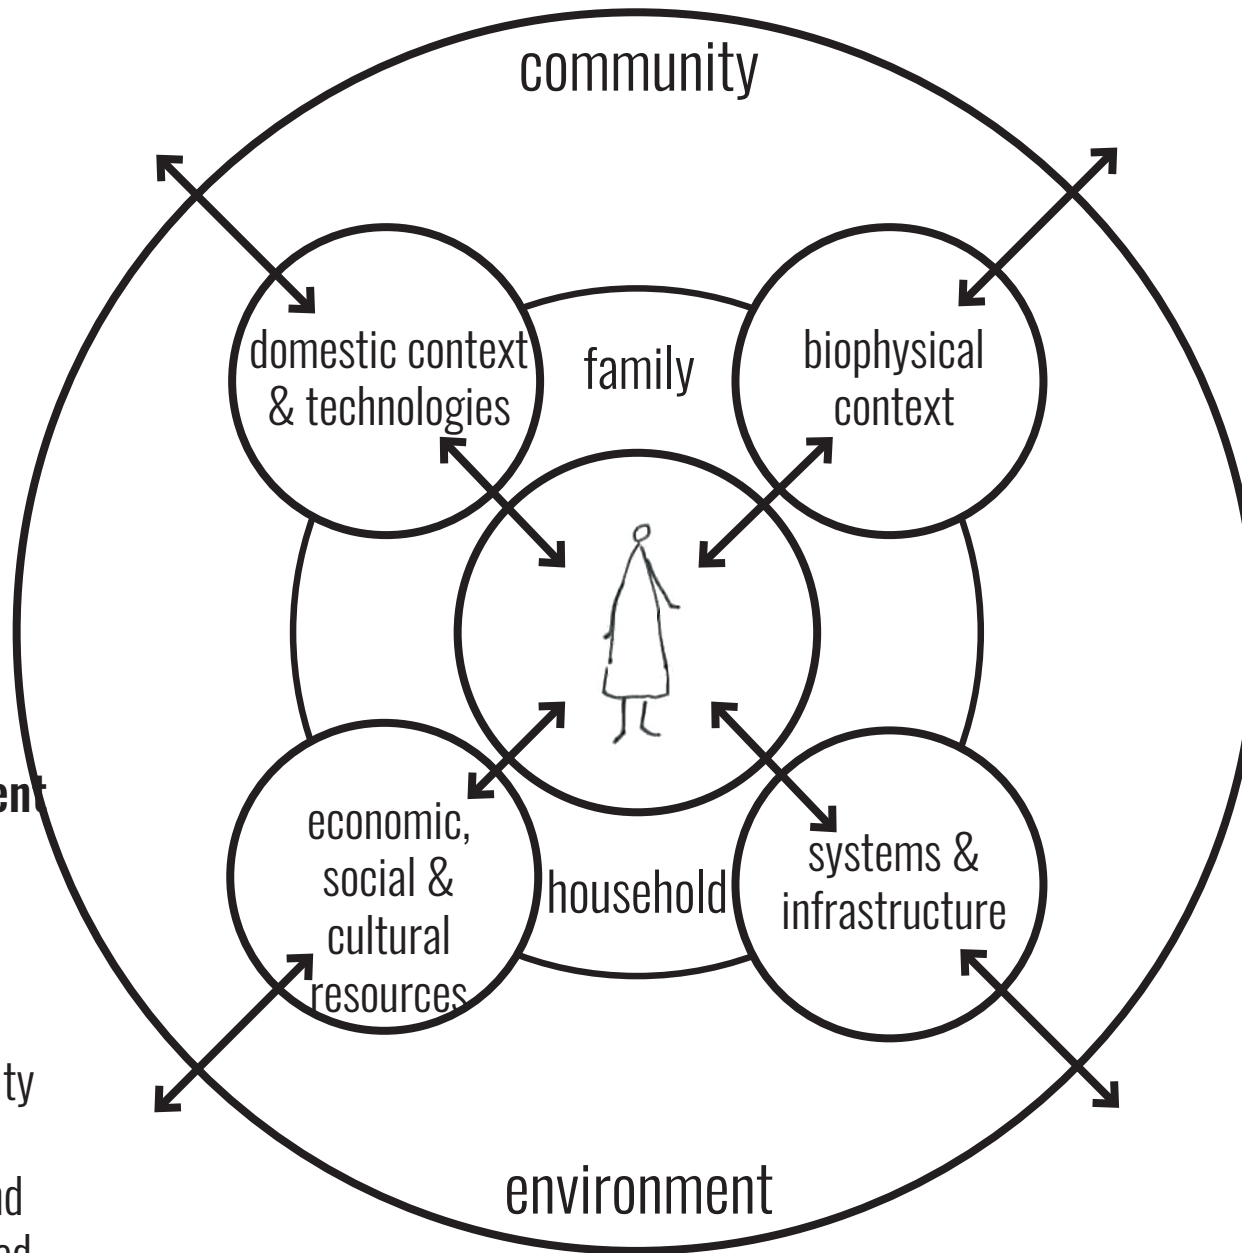

*Individual &
Household*

The **materials, meaning and competencies (knowledge)** that underpin the daily processes for water access and use are **shaped by intersecting biophysical, infrastructure, technical and socio-cultural dimensions.**

Meso

Community Scale

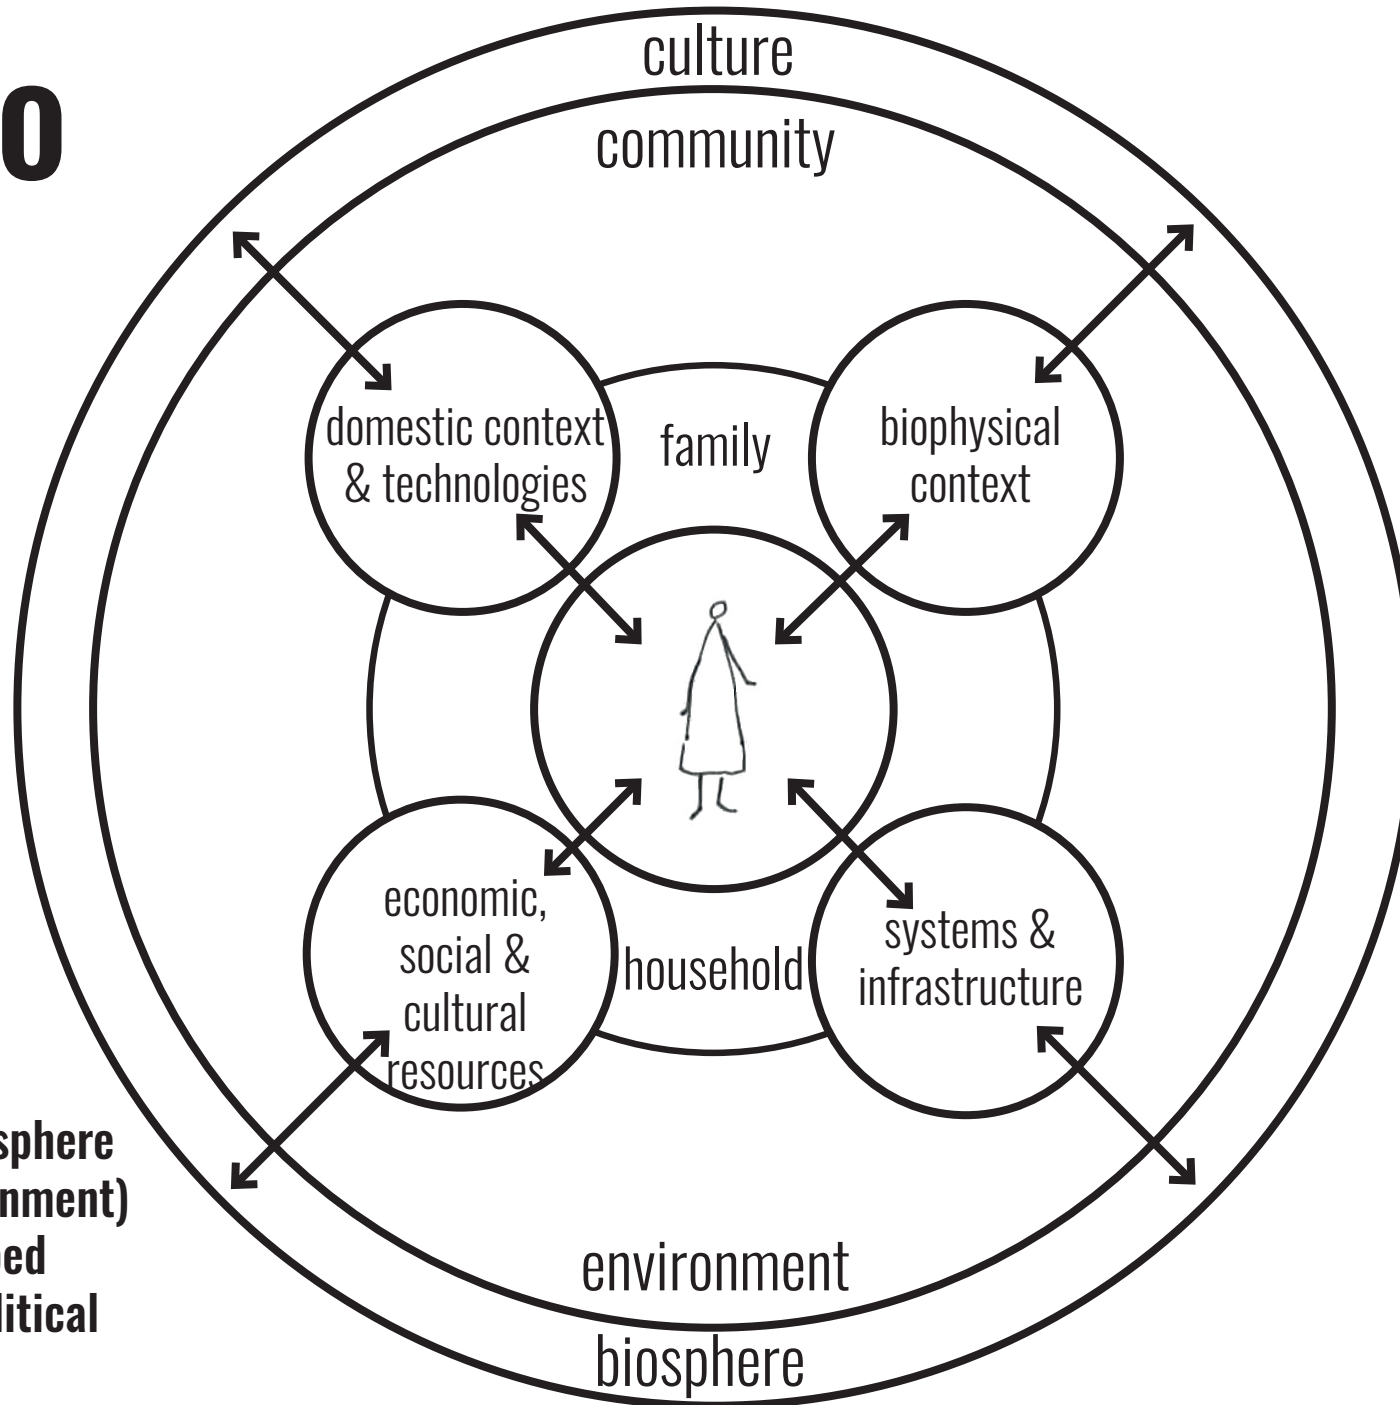

Intersection of **community (socio-cultural process of place)** with **environment (natural and built form)**.

Processes shaping the individual play out at the community scale.

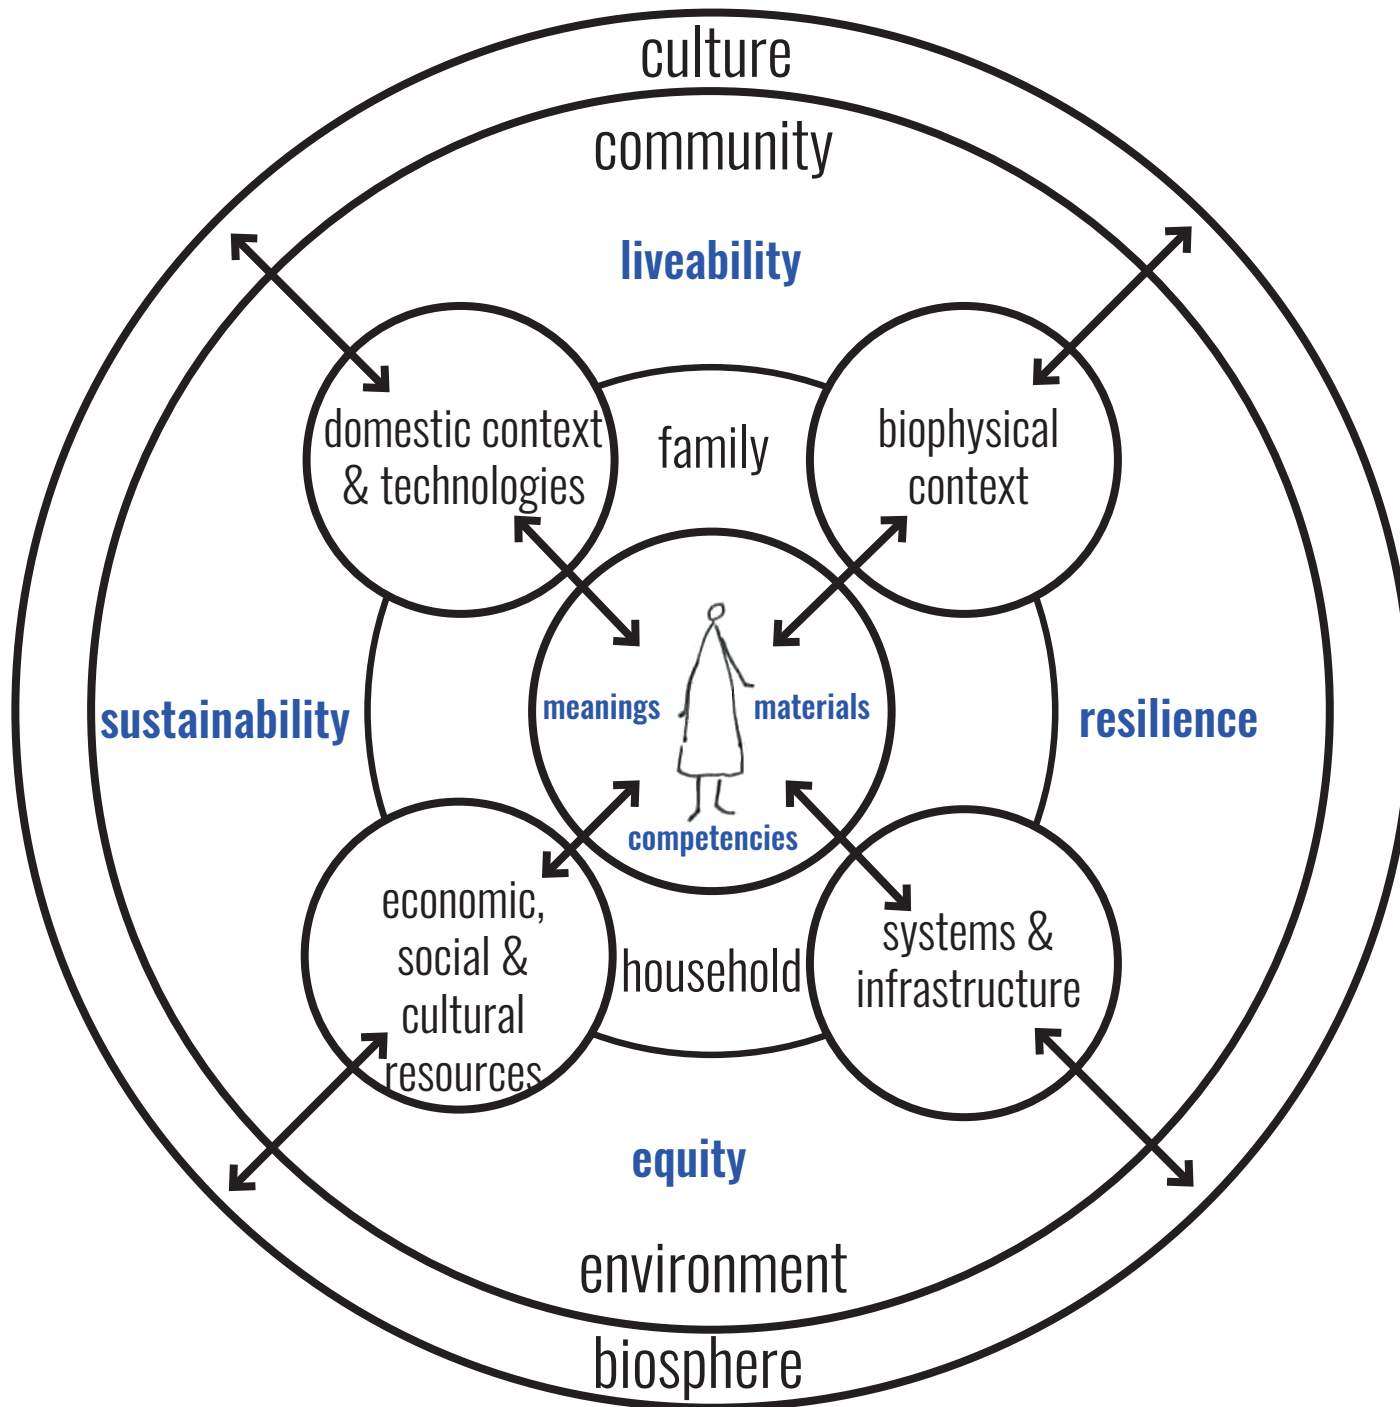

Knowledge, meaning and materials are experienced, access and re-perpetuated.

Macro

Context

Intersection of **biosphere**
(people in environment)
and **culture** (shaped
by **Social and Political**
dynamics)

What is the value of the framework?

Useful policy tool for developing more contextually sensitive water resource management responses.

What are the next steps?

Partnering with communities to pilot and test the efficacy of the framework.

For the framework to work effectively **more robust data collection is needed to determine the specific contextual needs and resources** (physical, social, natural, cultural or financial) that can be used to provide safe access to water.

Thank you!
